CONOWINGO HYDROELECTRIC PROJECT

FERC PROJECT NUMBER 405

Prepared for:

Prepared by:

Normandeau Associates, Inc.

Gomez and Sullivan Engineers, P.C.

August 2012

EXECUTIVE SUMMARY

Exelon Generation Company, LLC (Exelon) has initiated with the Federal Energy Regulatory Commission (FERC) the process of relicensing the 573-megawatt Conowingo Hydroelectric Project (Conowingo Project). The current license for the Conowingo Project was issued on August 14, 1980 and expires on September 1, 2014. FERC issued the final study plan determination for the Project on February 4, 2010, approving the revised study plan with certain modifications.

The final study plan determination required Exelon to conduct surveys for Maryland darter (*Etheostoma sellare*), which is the subject of this report. The objective of this study was to determine if Maryland darter are present in the Susquehanna River below Conowingo Dam and/or the lower riffles of Deer and Octoraro creeks.

An initial study report (ISR) was filed on February 22, 2011, containing Exelon's 2010 and January 2011 study findings. An initial study report meeting was held on March 9, 10, and 11, 2011 with resource agencies and interested members of the public. Formal comments on the ISR including requested study plan modifications were filed with FERC on April 27, 2011 by Commission Staff, several resource agencies and interested members of the public. Exelon filed responses to the ISR comments with FERC on May 27, 2011. On June 24, 2011, FERC issued a study plan modification determination order. The order specified what, if any, modifications to the ISRs should be made. For this study, FERC's June 24, 2011 order required no modifications to the original study plan. An updated study report (USR) was filed on January 23, 2012 describing the combined results of the 2010 and 2011 Maryland darter surveys. This final study report is being filed with the Final License Application for the Project.

Maryland darter surveys were initiated in October 2010 and concluded in early December 2011. Sampling in Deer and Octoraro creeks utilized electrofishing with a seine, and snorkeling. Twenty-four locations were sampled in Deer Creek and twelve locations were sampled in Octoraro Creek. The locations in Deer Creek included the riffle under the Stafford Bridge, the only location where Maryland darter has ever been recorded in Deer Creek, as well as many locations upstream and downstream of the Stafford Bridge. Sampling in the lower Susquehanna River using an electrified benthic trawl, supplemented with snorkeling and electrofishing (backpack electrofisher), was conducted between January and early December 2011. One hundred eighty-two locations in the lower Susquehanna River were sampled during the study. No Maryland darters were recorded; however, five of the six darter species that have been recorded in the lower Susquehanna River basin were collected, including the congeners *E. blennioides*, *E. zonale*, and *E. olmstedii*.

The program was successful in collecting fish of a wide range of sizes and species. Fifty-four species representing 13 families were collected, with 49 species from Deer Creek, 46 species from Octoraro Creek, and 40 species from the Susquehanna River. A total of 9,036 darters were collected and observed during this study program. The multiple sampling techniques employed over many locations, have demonstrated that fishes of similar size, morphology, and phylogeny to Maryland darter have been readily sampled.

The objective of conducting a thorough survey for Maryland darter in the lower Susquehanna River and lower reaches of Deer Creek and Octoraro Creek was accomplished. The Maryland darter has not been recorded since 1988 even though substantial effort has been expended in those specific areas where it had been recorded historically as well as extensive adjacent areas in Deer Creek (and Swan Creek and Gashey's Run), in Octoraro Creek, and in the Susquehanna River. With 182 sites sampled over four seasons and using multiple gear types, this survey represents the major sampling effort specifically for Maryland darter in the Susquehanna River. This information supplements other recent Maryland darter surveys in the river with the same gear that were supported by USFWS and MDNR.

1.0 INTRODUCTION

Exelon Generation Company, LLC (Exelon) has initiated with the Federal Energy Regulatory Commission (FERC) the process of relicensing the 573-megawatt (MW) Conowingo Hydroelectric Project (Project). Exelon is applying for a new license using the FERC's Integrated Licensing Process (ILP). The current license for the Conowingo Project was issued on August 14, 1980 and expires on September 1, 2014.

Exelon filed its Pre-Application Document (PAD) and Notice of Intent (NOI) with FERC on March 12, 2009. On June 11 and 12, 2009, a location visit and two scoping meetings were held at the Project for resource agencies and interested members of the public. Following these meetings, formal study requests were filed with FERC by several resource agencies. Many of these study requests were included in Exelon's Proposed Study Plan (PSP), which was filed on August 24, 2009. On September 22 and 23, 2009, Exelon held a meeting with resource agencies and interested members of the public to discuss the PSP.

Formal comments on the PSP were filed with FERC on November 22, 2009 by Commission staff and several resource agencies. Exelon filed a Revised Study Plan (RSP) for the Project on December 22, 2009. FERC issued the final study plan determination for the Project on February 4, 2010, approving the RSP with certain modifications.

The final study plan determination required Exelon to conduct surveys in 2010 and 2011 for Maryland darter (*Etheostoma sellare*), which is the subject of this report. The objective of this study was to determine if Maryland darter is present in the Susquehanna River below Conowingo Dam and/or the lower riffles of Deer and Octoraro creeks.

An initial study report (ISR) was filed on February 22, 2011, containing Exelon's 2010 study findings. An initial study report meeting was held on March 9, 10, and 11, 2011 with resource agencies and interested members of the public. Formal comments on the ISR including requested study plan modifications were filed with FERC on April 27, 2011 by Commission Staff, several resource agencies and interested members of the public. Exelon filed responses to the ISR comments with FERC on May 27, 2011. On June 24, 2011, FERC issued a study plan modification determination order. The order specified what, if any, modifications to the ISRs should be made. For this study, FERC's June 24, 2011 order required no modifications to the original study plan. An updated study report (USR) was filed on January 23, 2012 describing the combined results of the 2010 and 2011 Maryland darter surveys. This final study report is being filed with the Final License Application for the Project.

2.0 BACKGROUND

The Susquehanna River below Conowingo Dam flows approximately 10 miles before entering the Chesapeake Bay. The river is tidal up to the mouth of Deer Creek (a west side tributary with confluence at river mile (RM) 7). Octoraro Creek enters the river from the east at approximately RM 10.

2.1 Conowingo Project Operations

The Conowingo Project uses limited active storage within Conowingo Pond for generation purposes. Maximum hydraulic capacity of the Conowingo powerhouse is 86,000 cubic feet per second (cfs). The current minimum flow requirements below Conowingo Dam were formally established with the signing of a settlement agreement in 1989 between the Project owners and several federal and state resource agencies (46 FERC ¶61,063) ([FERC 1989](#)). The established minimum flow regime below Conowingo Dam is the following:

March 1 – March 31	3,500 cfs or natural river flow
April 1 – April 30	10,000 cfs or natural river flow, whichever is less
May 1 – May 31	7,500 cfs or natural river flow, whichever is less
June 1 – September 14	5,000 cfs or natural river flow, whichever is less
September 15 – November 30	3,500 cfs or natural river flow, whichever is less
December 1 – February 28	3,500 cfs intermittent (maximum six hours off followed by equal amount on)

The downstream discharge must equal these values or the discharge (natural river flow) measured at the Susquehanna River at the Marietta United States Geological Survey (USGS) gage (No. 01576000), whichever is less. The Marietta USGS gage is located approximately 35 miles upstream of Conowingo Dam above the Safe Harbor Dam.

2.2 Historic Occurrence of Maryland Darter in the Lower Susquehanna River Basin

The Maryland darter was first collected and identified as such in 1912 from Swan Creek near Havre de Grace, Maryland. It was not found again until 1962, in Gashey's Run ([Knapp 1963](#)), a tributary to Swan Creek. The last record in Gashey's Run is from 1965 ([Knapp 1976](#)). The first record in Deer Creek is also from 1965, and the last record from any location was in Deer Creek in 1988 ([Raesly 1991](#)).

Although significant efforts since 1986 to collect Maryland darter from Deer Creek have been conducted, no Maryland darters have been recorded ([Kazyak et al. 2005](#); [Kilian et al. 2010](#); [Raesly 1991, 1992, 2010, 2011](#); [Stauffer and Arnold 1986](#)).

All records of the Maryland darter are from the riffles in the lower reaches of the three small streams, Swan Creek, Gashey's Run, and Deer Creek. If the Maryland darter existed in any other streams, it was likely extirpated as the upper Chesapeake Bay area was settled and developed, resulting in degraded water quality and habitat due to land clearing and concomitant sedimentation in streams, shoreline development for towns and cities, and pollution ([Stranko et al. 2010](#)). [Neely and George \(2006\)](#) have documented the colonization of the Susquehanna River by the non-native greenside darter (*E. blennioides*) and state that the greenside darter may pose a serious threat to the Maryland darter.

There is evidence that the habitat in Deer Creek has deteriorated due to development ([SRBC 2008](#)). [SRBC \(2008\)](#) projected 25-year population increases of 23% in the lowermost Deer Creek subwatershed where the Maryland darter had been most abundant (immediately above the confluence with the Susquehanna River), and of 5 – 35% across all Deer Creek subwatersheds. [Raesly \(1991\)](#) reported that collections in Deer Creek reflected a significant drop in total fish collected and species richness over time during the late 1980's. In addition, he also reported increases in nitrate and chloride concentrations suggesting a deterioration of water quality ([Raesly 1991](#)). [Stranko et al. \(2010\)](#) concluded that effects of urbanization and non-native species were important factors in the extirpation or extinction of 13 aquatic species in Maryland, including the Maryland darter. These various studies suggest that development in the watershed may have been a significant factor in reducing numbers or eliminating Maryland darter from the basin.

METHODS

As recommended by agencies, Dr. Richard L. Raesly was integrated into this study as co-principal investigator. This report includes the schedule, locations, and results for the sampling program.

3.0 SAMPLING LOCATIONS AND SEASON

The sampling occurred over 15 months from October 2010 through early December 2011 in all four seasons. Thorough coverage of the river below Conowingo Dam and the lower reaches of Deer and Octoraro creeks was accomplished ([Figure 3.1-1](#))¹. Stream flow during the period of study varied widely, including flood conditions, in all three bodies of water ([Figure 3.1-2](#)). During the study period the Susquehanna River varied from under 3,000 cfs to approximately 770,000 cfs. Deer Creek varied from approximately 75 cfs to approximately 5,500 cfs, and Octoraro Creek varied from approximately 55 cfs to approximately 5,500 cfs.

One hundred eighty-two locations in the Susquehanna River were sampled. Locations were selected throughout the lower river from near Conowingo Dam down to Havre de Grace and Perryville at the mouth of the river. Shallow water (e.g., just below Conowingo Dam, near the islands off of Susquehanna State Park) and deep areas downstream toward the mouth of the river were sampled. Sampling in the river occurred in all four seasons from January through early December, 2011 ([Figures 3.1-3 - 3.1-6](#)). Harsh winter conditions in January required ice-breaking at the boat launches to gain access to the main stem river. Due to access and safety considerations, winter sampling was restricted to the lowermost portion of the river (i.e., from the vicinity of Lapidum and Port Deposit downstream to Havre de Grace and Perryville, see [Figure 3.1-1](#)).

Twenty-four locations in Deer Creek and 12 locations in Octoraro Creek were sampled. Riffles, runs, backwaters, and pools (where they could be waded) were sampled. Fall (2010 and 2011), spring, and summer sampling was completed in both creeks ([Figures 3.1-7 and 3.1-8](#)). Multiple attempts to sample the creeks in December 2010 and January 2011 were unsuccessful due to ice and slush ([Figure 3.1-9](#)). The Stafford Bridge riffle (see Deer Creek figures for location of the bridge, the riffle begins just upstream of the bridge and continues for approximately 100 m downstream of the bridge) in the lower portion of Deer Creek is the only location in the Susquehanna River drainage where Maryland darter has been found (Raesly 2010). This riffle, and numerous locations upstream and downstream of the Stafford Bridge, were sampled thoroughly by electrofishing and snorkeling.

3.1 Sampling Gear

An electrified benthic trawl ([Freedman et al. 2009](#)) was the primary means used to sample the lower Susquehanna River. The power was provided by a 3,500 W generator and rectified by a Smith-Root Type

¹ Note that the river is segmented into 4 reaches. Subsequent figures of the river are presented by reach.

VI-A electrofisher. The net was set from the front of a jon boat and pulled downstream slightly faster than the current. Snorkeling and electrofishing (with backpack electrofisher) were also used in the river to sample for Maryland darter. All three of these sampling gears and techniques have been used by MDNR and USFWS to sample for Maryland darter in the lower Susquehanna River ([Raesly 2011](#); [Killian et al. 2010](#)). All fish collected were identified to species. Darters were enumerated and the abundance of other species was recorded qualitatively.

Sampling in Deer and Octoraro creeks was conducted primarily by electrofishing along with a seine. A Smith-Root Model 12B backpack electrofisher was used along with a 5-ft by 10-ft seine with 1/8-inch mesh. At a given sampling location, the seine was cast downstream approximately 10 - 15 ft and held tight to the substrate. As soon as the seine was in place, the person carrying the electrofisher activated the unit, and with one or two other biologists, moved systematically toward the seine while kicking the substrate to chase fish into the electric field and subsequently into the seine. Fish collected in the seine were identified to species. Darter species were enumerated, and for other species a qualitative record of abundance was made. A series (approximate range of 100 - 160) of electrofishing/seine collections comprised the effort for each sampling location depicted in the figures. The backpack electrofisher (without the seine) was also used in some of the pools of the Susquehanna River where boat access was not possible.

Snorkeling was used in some portions of the Susquehanna River and in both creeks. This sampling method was conducted by a crew of 2 - 5 biologists spread across a selected reach. They moved upstream together through a reach, noting the species observed, and recording abundance. The locations sampled by gear type in the river and creeks are presented in [Figures 3.2-1 - 3.2-6](#).

4.0 RESULTS

4.1 Sampling Schedule and Effort

The sampling objective included seasonal sampling over extensive portions of the lower Susquehanna River and lower reaches of Deer and Octoraro creeks. Sampling in the lower river was accomplished in all four seasons; sampling in the creeks was accomplished in three seasons because ice cover and flowing ice prohibited sampling in the creeks during winter months. Sampling in the river, Deer Creek, and Octoraro Creek occurred on 20, 13, and 12 days, respectively during the study period ([Table 4.1-1](#)).

4.2 Maryland Darter

All of the sampling techniques were successful in collecting or observing numerous fish. Maryland darter ([Figure 4.2-1](#)) was not collected from any of the 218 locations sampled. However, five of the possible six darter species recorded historically in this portion of the Susquehanna River basin, including three congeners of the Maryland darter, were collected from the creeks and river. The multiple sampling techniques employed over many locations demonstrated that fishes of similar size, morphology, and phylogeny to Maryland darter were readily sampled, thus this was a sound approach for finding Maryland darter in these reaches if it still exists.

4.3 Species Richness

Fifty-four species representing 13 families were collected ([Table 4.3-1](#)). The greatest species richness (49) was recorded from Deer Creek. The numbers of species collected in Octoraro Creek and the lower river were 46 and 40, respectively.

4.4 Other Darter Species

The five species of darters recorded included the three congeners of Maryland darter, *Etheostoma blennioides* (greenside darter), *E. olmstedii* (tessellated darter), and *E. zonale* (banded darter), as well as *Percina bimaculata* (Chesapeake logperch), and *P. peltata* (shield darter). Darters were collected at 74% (161) of the 218 locations sampled in all three water bodies. Darters were collected in all four seasons ([Table 4.4-1](#)) and with all three gear types ([Table 4.4-2](#)). A total of 9,036 darters were collected. Of these, the tessellated darter (6,431 total or 71%) was by far the most common.

Chesapeake logperch, threatened in Maryland ([Ashton and Near 2010](#)), was second in total numbers with 1,886 recorded. This represents 21% of the total number of darters recorded. Chesapeake logperch was also the most abundant of the darter species in Octoraro Creek with 1,260 of the 2,471 (51%) darters recorded; this total number of Chesapeake logperch is weighted by a single observation during snorkeling

(August 26, 2011 at location #8), of a school of logperch estimated at 1,220 individuals. Sampling results for all darter species recorded by season and location are presented in [Table 4.4-1](#) and by season and gear in [Table 4.4-2](#). The locations where all species were recorded can be found in [Appendices A- C](#).

5.0 DISCUSSION

The objective of conducting a thorough Maryland darter survey in the lower Susquehanna River and lower reaches of Deer and Octoraro creeks was accomplished. Maryland darter was not collected during the surveys at any location.

This work complements the previous and concurrent work conducted through MDNR and USFWS in recent years (e.g., [Kilian et al. 2010](#); [Raesly 2010, 2011](#)). [Raesly \(2010\)](#) stated there was a small chance that Maryland darter is present in the Susquehanna River but that the limited effort spent and gear used up to that time in sampling specifically for Maryland darter in the river may not have been adequate to find the rare species. Exelon's study used multiple gear types (electrified benthic trawl, snorkeling, backpack electrofisher) and was designed to thoroughly sample the river. With 182 river locations sampled over the four seasons, and multiple gear types used, this survey represents the major sampling effort of Maryland darter in the Susquehanna River

TABLE 4.3-1: SPECIES OBSERVED IN THE LOWER SUSQUEHANNA RIVER, DEER CREEK, AND OCTORARO CREEK FROM OCTOBER 2010 – DECEMBER 2011.

Family	Genus species	Common Name	Susquehanna River	Deer Creek	Octoraro Creek	Total
Petromyzontidae	<i>Petromyzon marinus</i>	sea lamprey		x	x	
Anguillidae	<i>Anguilla rostrata</i>	American eel	x	x		
Clupeidae	<i>Alosa sp.</i>	River herrings/shad			x	
Clupeidae	<i>Dorosoma cepedianum</i>	gizzard shad	x	x	x	
Cyprinidae	<i>Campostoma anomalum</i>	central stoneroller		x	x	
Cyprinidae	<i>Carassius auratus</i>	goldfish	x	x	x	
Cyprinidae	<i>Clinostomus funduloides</i>	rosyside dace		x	x	
Cyprinidae	<i>Cyprinella analostana</i>	satinfm shiner	x	x	x	
Cyprinidae	<i>Cyprinella spiloptera</i>	spotfin shiner	x	x	x	
Cyprinidae	<i>Cyprinella sp.</i>	shiner	x	x	x	
Cyprinidae	<i>Cyprinus carpio</i>	common carp	x		x	
Cyprinidae	<i>Exoglossum maxillingua</i>	cutlips minnow		x	x	
Cyprinidae	<i>Hybognathus regius</i>	Eastern silvery minnow		x		
Cyprinidae	<i>Luxilus cornutus</i>	common shiner		x	x	
Cyprinidae	<i>Nocomis micropogon</i>	river chub		x	x	
Cyprinidae	<i>Notropis amoenus</i>	comely shiner	x	x	x	
Cyprinidae	<i>Notropis hudsonius</i>	spottail shiner	x	x	x	
Cyprinidae	<i>Notropis procne</i>	swallowtail shiner	x	x	x	
Cyprinidae	<i>Notropis rubellus</i>	rosyface shiner	x	x	x	
Cyprinidae	<i>Pimephales notatus</i>	bluntnose minnow		x	x	
Cyprinidae	<i>Rhinichthys atratulus</i>	blacknose dace	x	x	x	
Cyprinidae	<i>Rhinichthys cataractae</i>	longnose dace	x	x	x	
Cyprinidae	<i>Semotilus atromaculatus</i>	creek chub		x	x	
Cyprinidae	<i>Semotilus corporalis</i>	fallfish		x	x	
Catostomidae	<i>Carpiodes cyprinus</i>	quillback	x	x	x	
Catostomidae	<i>Catostomus commersoni</i>	white sucker	x	x	x	
Catostomidae	<i>Erimyzon oblongus</i>	creek chubsucker	x			
Catostomidae	<i>Hypentelium nigricans</i>	northern hog sucker	x	x	x	
Catostomidae	<i>Moxostoma macrolepidotum</i>	shorthead redbhorse	x	x	x	
Ictaluridae	<i>Ameiurus natalis</i>	yellow bullhead			x	
Ictaluridae	<i>Ameiurus nebulosus</i>	brown bullhead	x	x	x	
Ictaluridae	<i>Ictalurus punctatus</i>	channel catfish	x	x	x	
Ictaluridae	<i>Pygodictis olivaris</i>	flathead catfish	x	x		
Ictaluridae	<i>Noturus insignis</i>	margined madtom	x	x	x	
Salmonidae	<i>Salmo trutta</i>	brown trout		x		
Belonidae	<i>Strongylura marina</i>	Atlantic needlefish	x	x		
Fundulidae	<i>Fundulus diaphanus</i>	banded killifish	x	x	x	
Moronidae	<i>Morone americana</i>	white perch	x	x	x	
Moronidae	<i>Morone saxatilis</i>	striped bass	x	x	x	
Centrarchidae	<i>Amploplites rupestris</i>	rock bass	x	x	x	
Centrarchidae	<i>Lepomis auritis</i>	redbreast sunfish	x	x	x	
Centrarchidae	<i>Lepomis cyanellus</i>	green sunfish	x	x	x	
Centrarchidae	<i>Lepomis gibbosus</i>	pumpkinseed	x	x	x	
Centrarchidae	<i>Lepomis macrochirus</i>	bluegill	x	x	x	
Centrarchidae	<i>Micropterus dolomieu</i>	smallmouth bass	x	x	x	
Centrarchidae	<i>Micropterus salmoides</i>	largemouth bass	x	x	x	
Percidae	<i>Etheostoma blennioides</i>	greenside darter	23	4	12	39
Percidae	<i>Etheostoma olmstedti</i>	tessellated darter	2819	2647	965	6431
Percidae	<i>Etheostoma zonale</i>	banded darter	125	45	81	251
Percidae	<i>Percina bimaculata</i>	Chesapeake logperch	262	364	1260	1886
Percidae	<i>Percina peltata</i>	shield darter	46	230	153	429
Percidae	<i>Perca flavescens</i>	yellow perch	x	x	x	
Percidae	<i>Sander vitreum</i>	walleye	x			
Cottidae	<i>Cottus caeruleoementum</i>	blue ridge sculpin		x		
						9036

TABLE 4.4-1: DARTER SPECIES AND NUMBERS COLLECTED IN THE SUSQUEHANNA RIVER, DEER CREEK, AND OCTORARO CREEK BY LOCATION AND SEASON FROM OCTOBER 2010 – DECEMBER 2011.

Season	Site Nos.	<i>Etheostoma blennioides</i>	<i>E. olmstedii</i>	<i>E. zonale</i>	<i>E. sellare</i>	<i>Percina bimaculata</i>	<i>P. peltata</i>	Total
Susquehanna River								
Winter	6, 12, 13, 15, 16, 18, 22, 25, 27, 33-43	0	297	0	0	0	0	297
Spring	46-55, 60-65, 70, 71, 78, 80, 83, 86, 91, 92, 97-101	0	465	4	0	36	21	526
Summer	103-106, 108-111, 113-115, 118-125, 145-157	23	1426	110	0	212	22	1793
Fall	126-144, 158-175, 178-181	0	631	11	0	14	3	659
Total	126 sites	23	2819	125	0	262	46	3275
Deer Creek								
Fall	1-6, 22-24	3	2082	32	0	61	83	2261
Winter	**	**	**	**	**	**	**	**
Spring	7-16	0	315	2	0	226	76	619
Summer	18-21	1	250	11	0	77	71	410
Total	23 sites	4	2647	45	0	364	230	3290
Octoraro Creek								
Fall	1-3, 11, 12	7	394	48	0	14	97	560
Winter	**	**	**	**	**	**	**	**
Spring	4-6	0	59*	0	0	11	0	70*
Summer	7-10	5	512	33	0	1235	56	1841
Total	12 sites	12	965*	81	0	1260	153	2471*
All Streams Combined								
Total	161 Sites	39	6431	251	0	1886	429	9036

*Note: During one snorkel survey *E. olmstedii* was recorded qualitatively as 'common' (defined as between 10 and 100) rather than enumerated, so the actual number for the cumulative surveys was greater by 11-99.

** No sampling done

TABLE 4.4-2: DARTER SPECIES AND NUMBERS COLLECTED IN THE SUSQUEHANNA RIVER, DEER CREEK, AND OCTORARO CREEK BY SEASON AND GEAR TYPE WITH EFFORT FROM OCTOBER 2010 – DECEMBER 2011.

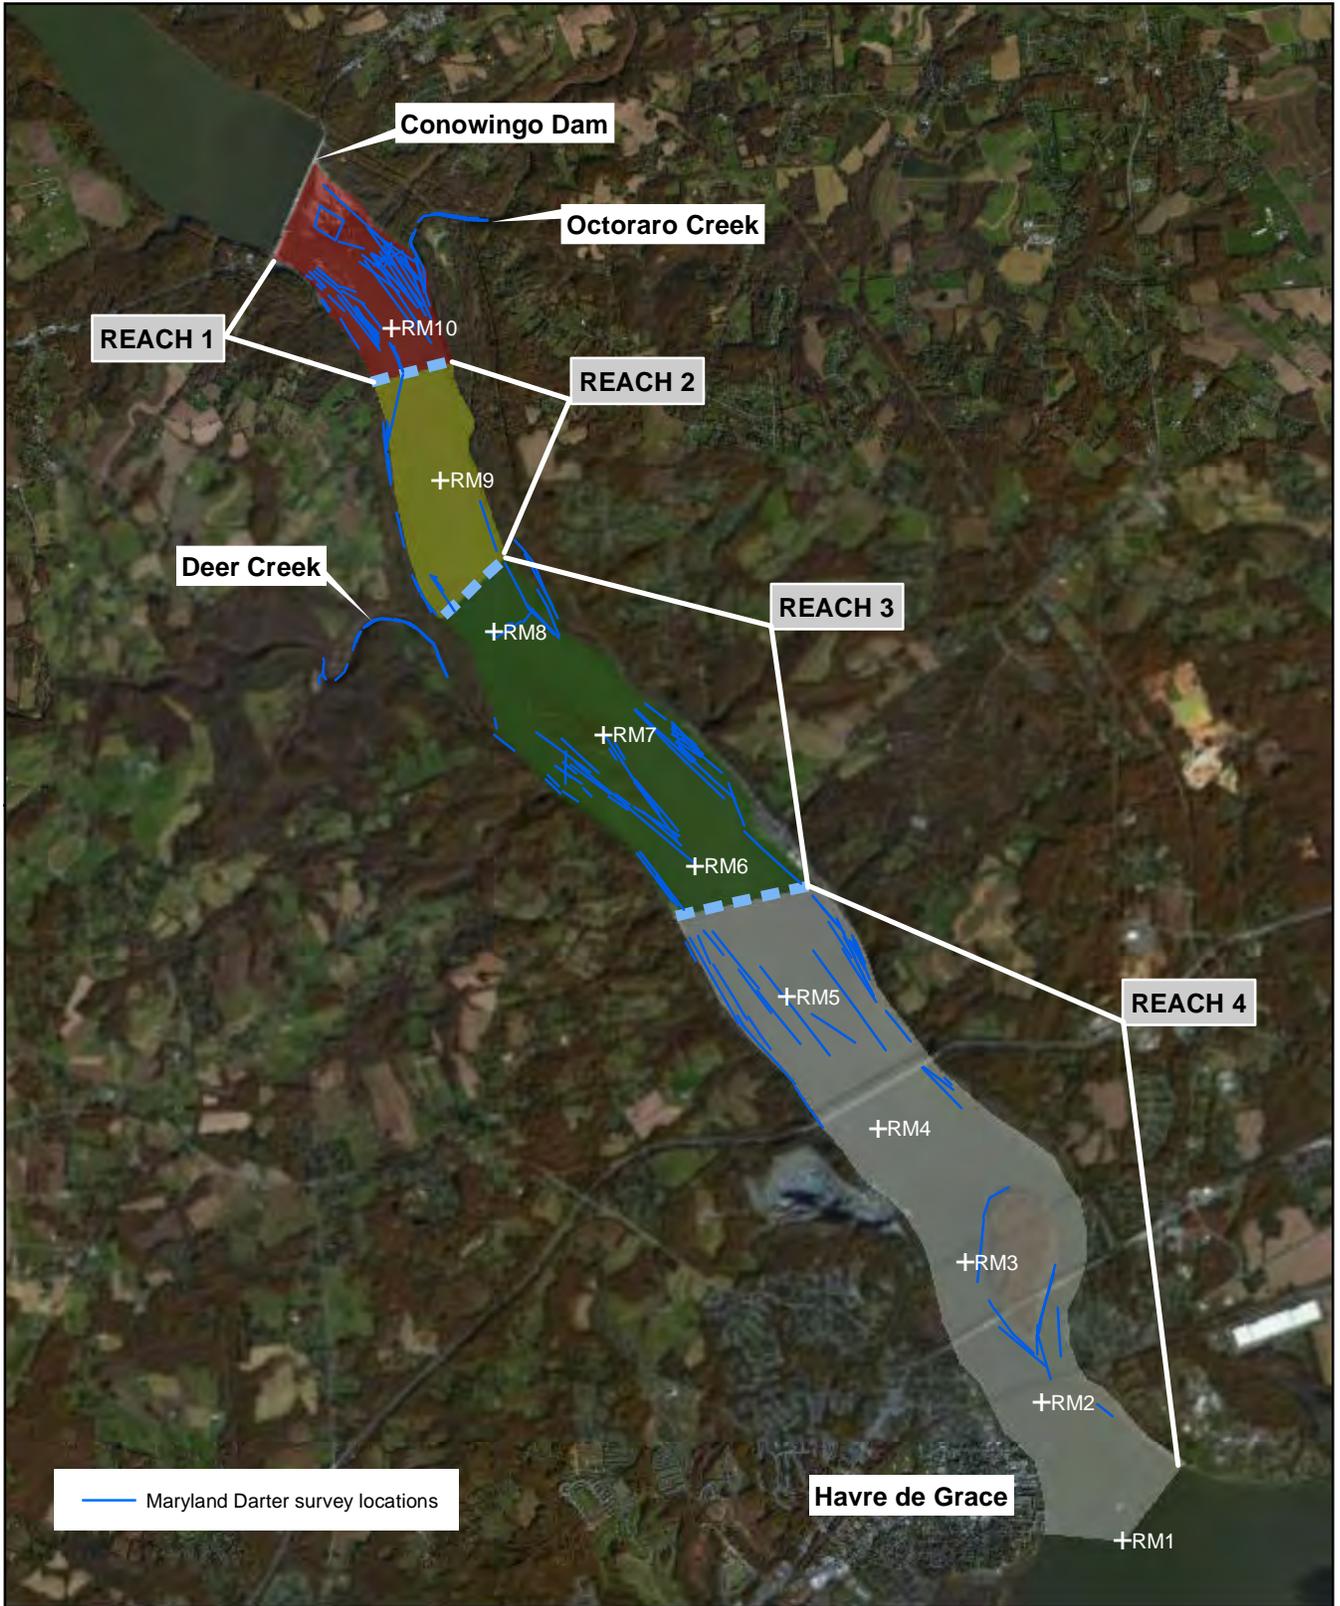

Susquehanna River	<i>Etheostoma blennioides</i>	<i>E. olmstedii</i>	<i>E. zonale</i>	<i>E. sellare</i>	<i>Percina bimaculata</i>	<i>P. peltata</i>	Row Sum	Cumulative Effort (seconds of shocking or observing)
